

SWAT Delivery Systems

TF Technology

SWAT: OVERVIEW

The SWAT specialized odor delivery systems are focused on providing the waste and other heavy industries with an effective and flexible way to deliver odor control products to the source of the offensive odors. NWC leverages 2 different Fan Technologies and uses these technologies on mobile and stationary platforms.

THE FAN TECHNOLOGIES

NWC's research and development team spent 100's of hours trying to find the most effective way to deliver odor control products to the source of the odors. They decided on 3 distinct technologies each with its own pro's and con's. They felt by offering all three dissemination technologies together that a more effective odor control delivery system could be achieved.

SWAT: TF TECHNOLOGY

The SWAT TF Series is the most powerful of our odor control delivery platforms. It uses a technology similar to a jet engine and can straight line mist up to 200ft/65m. The technology is available as a add on to a CAPS Machine or as a Standalone vehicle with an option for up to 3 fans covering an 270 degree area.

SWAT: RF TECHNOLOGY

The SWAT RF Series is an affordable long duration misting applications. It uses a hydraulically driven rotary fan with switchable misting baskets, which allows you to adjust the size of the droplets. Although it doesn't project as far as the TF system it can easily reach 100ft/30m. It is available in a kit with timers and a remote control system or on a mobile vehicle platform similar to the TF technology.

SWAT: FN TECHNOLOGY

The SWAT FN Series uses a cost effective fixed nozzle misting technology. It can be combined with a variety of fan technologies to disperse the mist over a larger area. It also is available as a standalone system often used in perimeter fencing and indoor misting systems. When combined with a mobile platform and fan technology it can be an effective odor delivery solution (check out the pictures to the right).

TRUE PRODUCT INTEGRATION

Imagine driving a car, and when you needed to gas up, you find out only certain pump nozzles would fit your gas tank. What's more, you couldn't put just any gasoline into your engine – only one particular blend. Then when it came to changing the oil, only one type of filter would work. You'd be more than a bit frustrated, I'm sure!

At NWC we make it easy for our clients and customers: All of our products and equipment are compatible with each other. This idea is simple yet seemingly revolutionary in the waste and environmental industries. (It almost seems some companies go out of their way in making life as difficult as possible for their landfill customers!)

But by making all of our products compatible, the money our clients save is significant – especially if you think in terms of labor and equipment expenditures.

The ability to do 2 things at the same time is obviously appealing due to labor costs. But picture having a single piece of equipment doing 3 different things – that sure is better than having 3 different pieces of equipment for each operation.

SOME OF THE COMBINATIONS OUR CUSTOMERS ARE USING TODAY

- *Bacteria & Enzymes Odor Control + Daily Cover*
- *Seeds + Stimulants + Cover*
- *Odor Control + Daily Cover*
- *Bird Control + Odor Control*
- *Insect Control + Odor Control + Daily Cover*
